RIDE SHARING PLATFORM

Ride Sharing Platform

Introduction:

In today's fast-paced world, the need for efficient and convenient transportation solutions has never been greater. The "Development of a Ride-Sharing Platform" project aims to address this need by creating a robust and user-friendly platform that offers ride booking, carpooling, and secure payment processing. This project holds significant importance in improving the way people commute, reducing traffic congestion, and promoting eco-friendly transportation options.

Project Overview

Scope:

- Offer users the ability to book electric vehicles (EVs) for rides.
- Encourage carpooling as a means to reduce traffic congestion and carbon emissions.

Objectives:

- Develop a functional prototype of the ride-sharing platform.
- Implement essential functionalities including ride booking, carpooling, and payment processing.
- Create both web and mobile applications to cater to a wider user base.
- Follow the Agile Software Development Life Cycle (SDLC) process for iterative and collaborative development.

Project Requirements

The functional and non-functional requirements for the ride-sharing platform are as follows.

Functional Requirements:

1. User Registration:

- Users must be able to create accounts using email, phone number, or social media profiles.
- The system should verify user information for authenticity and security.
- Users should have the option to provide personal information and a profile picture.
- Password reset and account recovery functionality should be available.
- Users should be able to specify their role (passenger or driver) during registration.

2. Ride Booking:

- Passengers should be able to search for available rides based on their current location and destination.
- Passengers should see a list of available drivers, along with driver ratings and vehicle - information.
- Passengers should be able to request a ride, specifying the number of passengers and any special requirements.
- Drivers should receive ride requests and have the option to accept or decline them.

Upon acceptance, passengers should receive confirmation with estimated arrival time and driver details.

- Passengers and drivers should be able to communicate through in-app messaging or calls.
- Users must be able to specifically book electric vehicles (EVs) for rides to reduce carbon emissions.

3. Carpooling:

- The platform must support carpooling where multiple passengers can share a ride.
- Passengers should be able to opt for carpooling during ride booking.

4. Payment Processing:

- Users should be able to link their payment methods (credit card, PayPal, etc.) securely.
- The platform should calculate and display fare estimates before confirming the ride.
- Payments should be processed automatically after the completion of the ride.
- Users should receive digital receipts for their rides.

Non Functional Requirements:

1. Performance:

- The platform must handle a large number of concurrent users and transactions efficiently.
- Response times for ride requests and updates should be minimal.

2. Security:

- Authentication and authorization mechanisms should be robust to prevent unauthorized access.
- Response times for ride requests and updates should be minimal.

3. Scalability:

- The system should be designed to scale horizontally to accommodate increasing user and driver numbers.
- The platform should provide a mechanism for passengers and drivers to rate and review each other.
-

4. Feedback and Rating system:

- The platform should provide a mechanism for passengers and drivers to rate and review each other.

System Architecture and Design

UseCase diagram

To summarize the details of Ride Sharing system's users (also known as actors) and their interactions with the system.

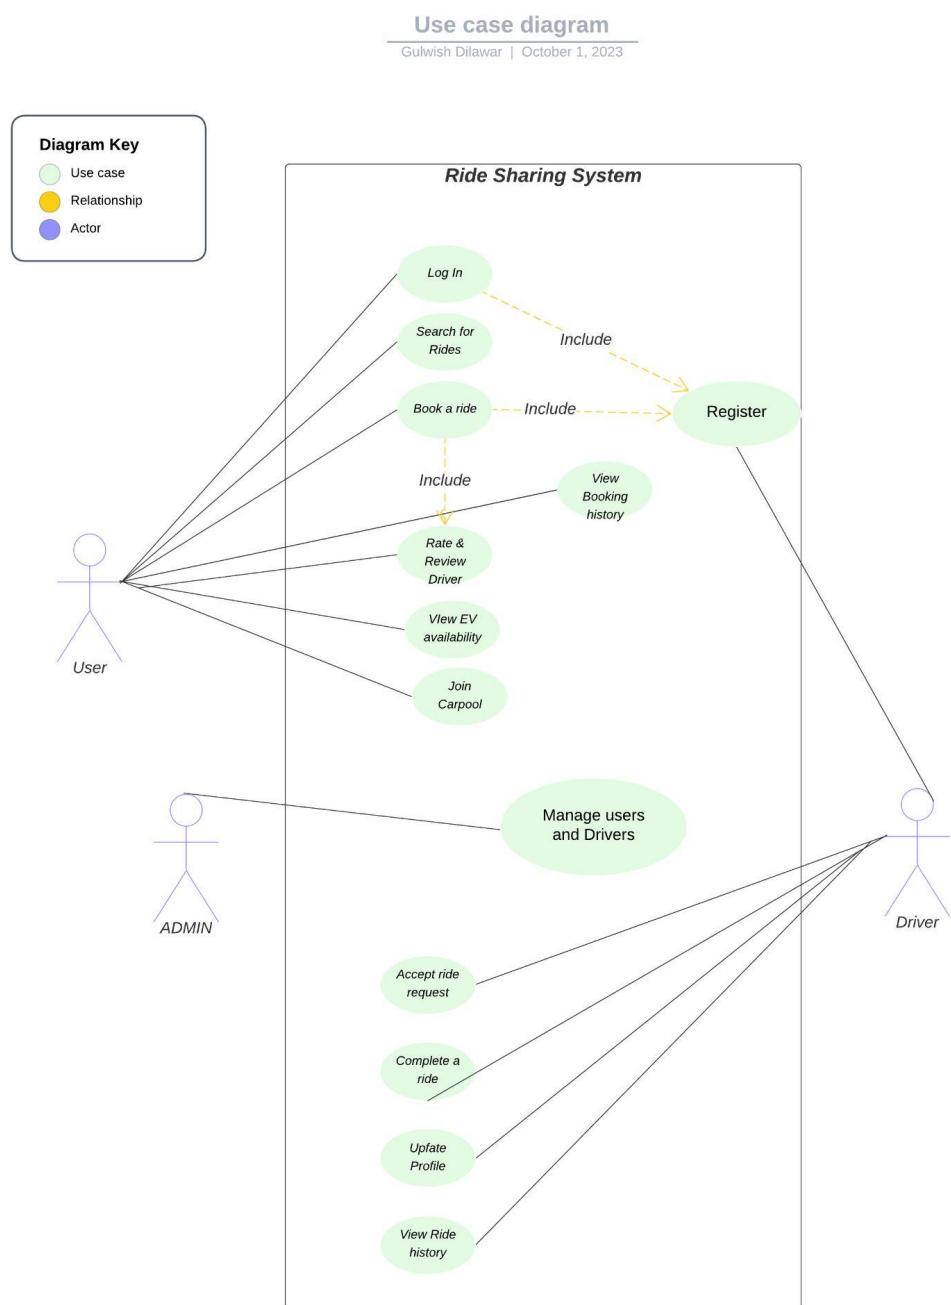

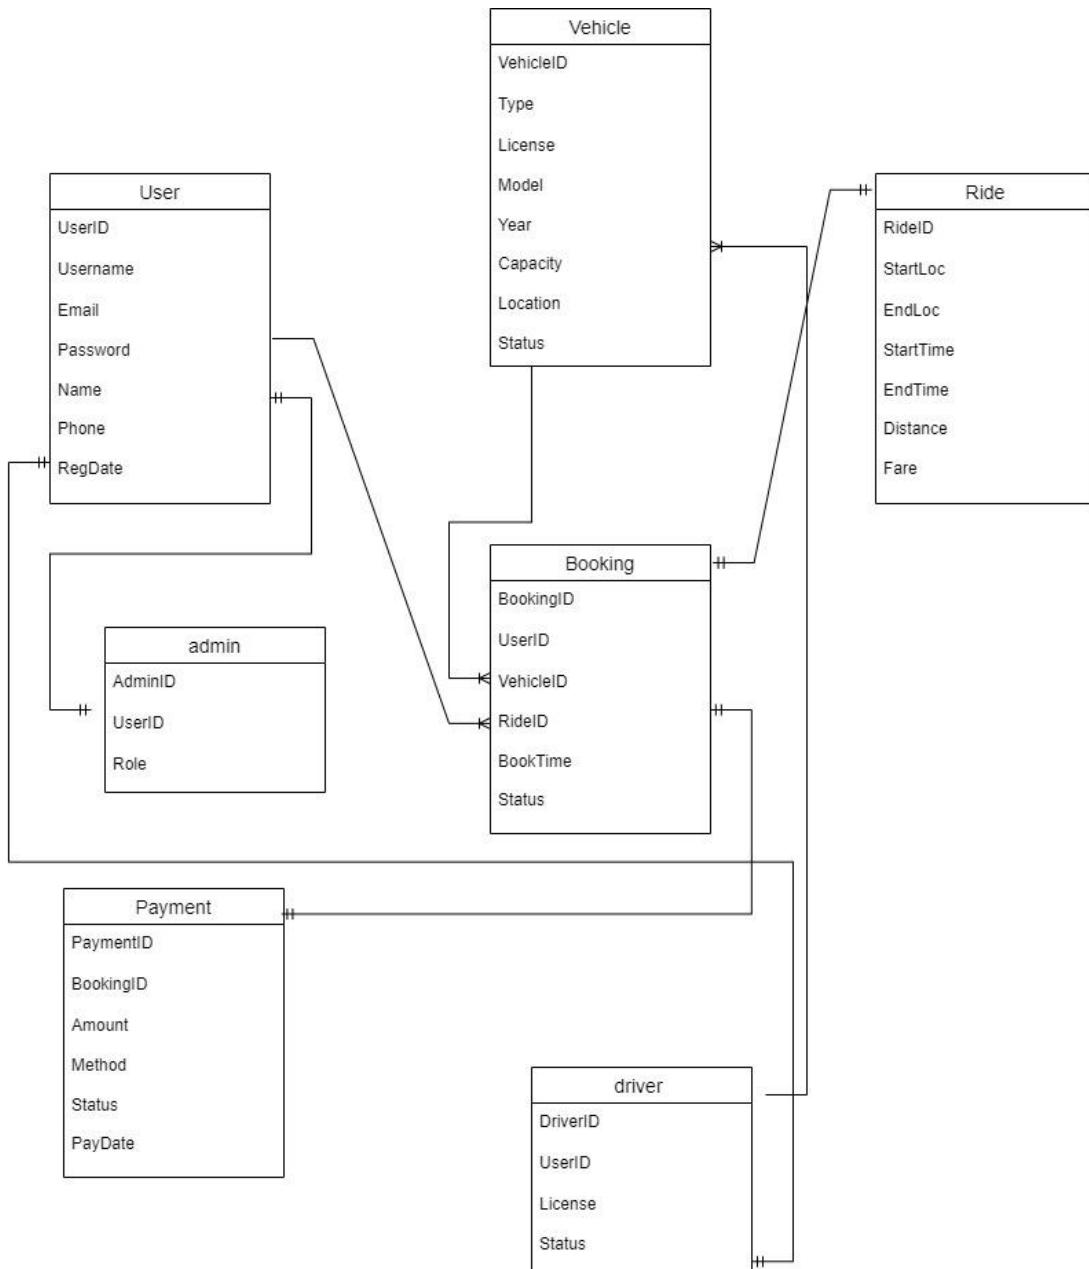

Fig 5.1.1

Class diagram

Representing the core entities and objects in the ride-sharing platform.

Fig

5.1.2

Entities:

1. The "User" entity stores information about registered users.
2. The "Vehicle" entity contains details about each vehicle in the system.
3. The "Ride" entity records information about each individual ride.
4. The "Booking" entity links users to their booked rides.
5. The "Payment" entity stores payment details associated with each booking.
6. The "Driver" entity stores information about registered drivers.
7. The "Admin" entity stores the information about the user as well as admin.

Relationships:

1. One User can have many Bookings (One-to-Many):
- User (UserID) -> Booking (UserID)
2. One Vehicle can be part of many Bookings (One-to-Many):
- Vehicle (VehicleID) -> Booking (VehicleID)
3. One Booking corresponds to one Ride (One-to-One):
- Booking (RideID) -> Ride (RideID)
4. One Booking can have one Payment (One-to-One):
- Booking (BookingID) -> Payment (BookingID)

Project Timeline and Effort

PROJECT TIMELINE

PHASES	Start Date & Duration					
	7-18 Aug (2 weeks)	20Aug - 2 Sep (2 weeks)	3Sept- 23Sept (3 weeks)	3Sept- 26Sept (4 weeks)	26Sept-28Sept (1 week)	29sep-1 oct
Requirements Gathering & Planning						
Design & Prototyping						
Development						
Testing						
Maintenancce						

1. Planning & Analysis

gathering business requirements from project scope. Evaluated the cost of developomnet effort and scope of project.

2. Define Requirements

converting the information gathered during the planning and analysis phase into clear requirements for the development team. This process guides the development of several important documents: a software requirement specification (SRS), a Use Case document, and a Requirement Traceability Matrix document.

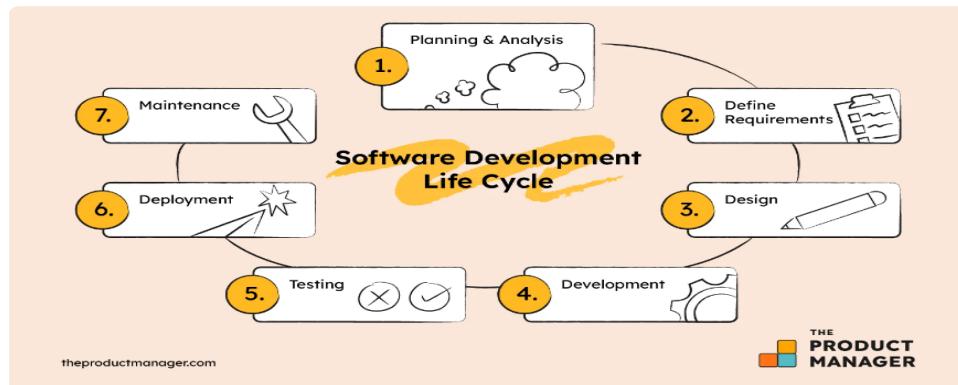

3. Design

The original plan and vision are elaborated into a software design document (SDD) that includes the system design, programming language, templates, platform to use, and application security measures.

To visualize what the product will look like and make changes without having to go through the hassle of rewriting code.

4. Development

the development team members divided the project into software modules and turn the software

requirement into code that makes the product.

In some cases, the development stage can also merge with the testing stage where certain tests are run to ensure there are no critical bugs.

5. Testing

Before getting the software product out the door to the production environment, it's important to have your quality assurance team perform validation testing to make sure it is functioning properly and does what it's meant to do. The testing process can also help hash out any major user experience issues and security issues.

In some cases, software testing can be done in a simulated environment. Other simpler tests can also be automated.

The types of testing to do in this phase:

- Performance testing: Assesses the software's speed and scalability under different conditions
- Functional testing: Verifies that the software meets the requirements
- Unit-testing: Tests individual units or components of the software
- Usability testing: Evaluates the software's user interface and overall user experience
- Acceptance testing: Also termed end-user testing, beta testing, application testing, or field testing, this is the final testing stage to test if the software product delivers on what it promises

6. Deployment(Alpha Release)Alpha Version

- the software that is in its first phase of software testing.to ensure that all modules are integrated properly and functioning as expected.
- Alpha testing is performed by internal employees or developers.
- This type of test is performed at the developer's site but not at the customer's site. Alpha testing is conducted after the completion of the system testing and before the beta testing. This test is done to find out bugs or defects related to usability, functionality, and consistency.

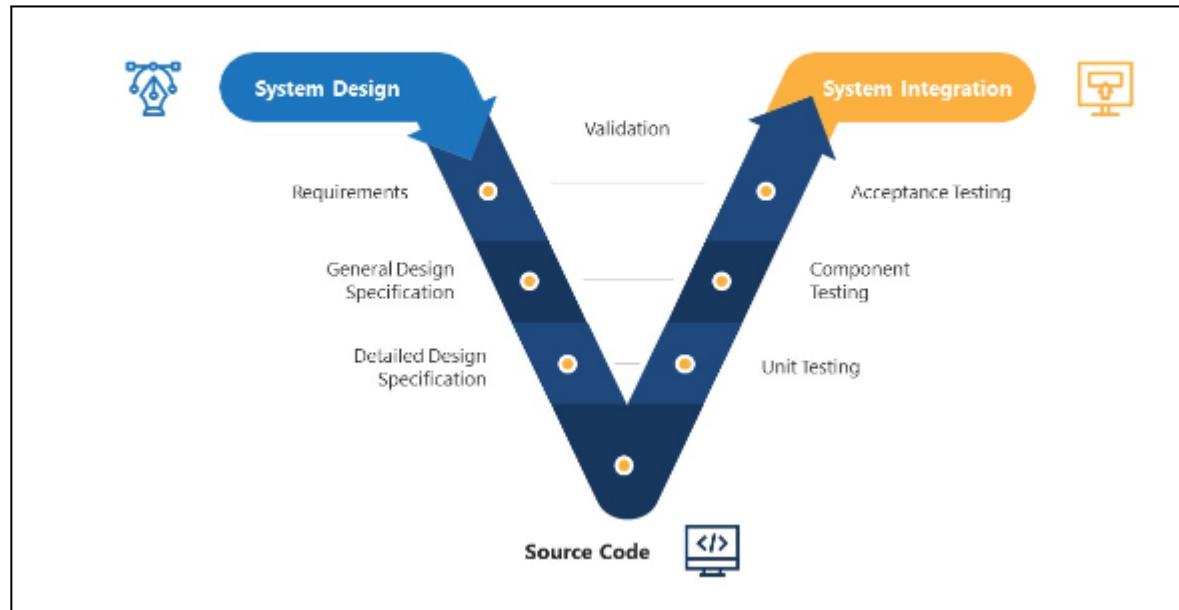

7. Maintenance

the industry is moving towards a more agile software development approach where maintenance is only a stage for further improvement.

In the maintenance stage, users may find bugs and errors that were missed in the earlier testing phase. These bugs need to be fixed for better user experience and retention. In some cases, these can lead to going back to the first step of the software development life cycle.

Software Development LifeCycle

Methodology

Quality Assurance process

Quality assurance is a critical aspect of ensuring the reliability and effectiveness of the eco-friendly ride-sharing platform.

We performed quality assurance activities to design a comprehensive set of test cases covering user scenarios, vehicle availability, payment processing, and navigation.

Along with present graphical representations of test cases executed at different SDLC lifecycle stages, showing passed and failed cases with explanations.

Test Cases

Planning and Designing

Ride Booking:

Test ride booking with valid locations and preferences:

- Preconditions: User is logged in and on the ride booking screen.
- Input: Provide valid pickup and drop-off locations, select ride preferences (e.g., vehicle type, carpooling).
- Expected Outcome: The system should find available drivers, calculate the fare, and display ride confirmation details.

Test ride booking with invalid or unreachable locations:

- Preconditions: User is logged in and on the ride booking screen.
- Input: Provide invalid or unreachable pickup and drop-off locations.
- Expected Outcome: The system should display an error message indicating that the locations are invalid or unreachable.

Verify that users receive ride confirmation details:

- Preconditions: User has successfully booked a ride.
- Expected Outcome: After confirming the ride, the user should receive confirmation details, including driver information, vehicle details, and estimated arrival time.

Carpooling:

Test carpooling by booking rides with multiple passengers:

- Preconditions: Users are logged in and on the ride booking screen.
- Input: Select the carpooling option and specify the number of passengers.
- Expected Outcome: The system should match multiple passengers for carpooling, calculate individual fares, and display confirmation details for each passenger.

TEST CASE TEMPLATE

Test Case #: ER001	Test Case Name: User login with valid information
System: Eco Ride application	Subsystem: User Registration

Designed by: test designer	Design Date: Jul 31, 2023
Executed by: tester	Execution Date: Jul 31, 2023
<p>Short Description: Verify that users can successfully register on the system with valid information and that they receive a verification code for account activation.</p>	

Pre Condition: <ul style="list-style-type: none"> - The mobile application is installed and launched on the device. - the registration page is loaded.
--

Step	Action	Expected System Response	Pass/ Fail	Comment
1	Launch the registration page of the system. Pass	The registration page is displayed successfully.	Pass	
2	Enter valid registration information, including: - Valid email address - Valid phone number	The system accepts the information without errors.	Pass	
3	Submit the registration form. Pass	The system processes the registration request.	Pass	
4	Check the registered email inbox or SMS for a verification code.	A verification code is received within a reasonable time.	Pass	
5	Verify that the user is logged in after successful registration.	The user is redirected to their account or homepage after registration.	Pass	
6	Attempt to register another user with the same email address or phone number. Pass	The system should display an error message indicating that the email or phone number is already in use.	Pass	
7	Attempt to register another user with the same email address or phone number. Pass	The system should display an error message indicating that the email or phone number is already in use.	Pass	
8	Attempt to register with an invalid email format (e.g., without "@" symbol).	The system should display an error message indicating that the email format is invalid.	Pass	
	Attempt to register with a duplicate phone number.	The system should display an error message indicating that the phone number is already in use.		

Post-Conditions:
 -Post-Conditions: - A new user account is successfully registered. - The user is logged in and able to access their account.

This use case outlines the key steps and interactions involved in the "User Registration" scenario, including user input validation and the verification process. It can serve as a basis for designing and testing the registration functionality on the EcoRide ride-sharing platform.

Test cases at SDLC phases

1. Unit Testing : Objective: Verify the correctness of individual components and functions within the ride-sharing platform.

- Detailed test scenarios are created to cover a wide range of Booking Functionality.
 - Confirm that the booking function processes ride requests accurately.
 - Test edge cases such as booking rides for various distances and different user profiles.

2. Integration Testing: Objective: Ensure that different modules and components of the ride-sharing platform work together seamlessly.

Test Cases:

User-Driver Interaction:

- Verify that the user can successfully book rides with available drivers.
- Test communication between the user and driver modules.

Carpooling Integration:

- Confirm that carpooling features integrate smoothly with ride booking.
- Test scenarios where multiple users share rides.

Payment Integration:

- Ensure that payment processing integrates with booking and that payments are processed correctly.

3. System Testing Objective: Assess the entire eco-friendly ride-sharing platform as a unified system, testing functionality, performance, and user experience.

Test Cases:

End-to-End Ride Booking:

- Simulate real-world scenarios where users search, book, and complete rides from start to finish.

Performance Testing:

- Evaluate system performance under varying loads, including peak usage times.
- Assess response times, scalability, and resource utilization.

User Experience (UX) Testing:

- Test the platform's user interface (UI) for consistency, responsiveness, and ease of use.
- Verify that users can navigate and interact with the platform intuitively.

Search Here...

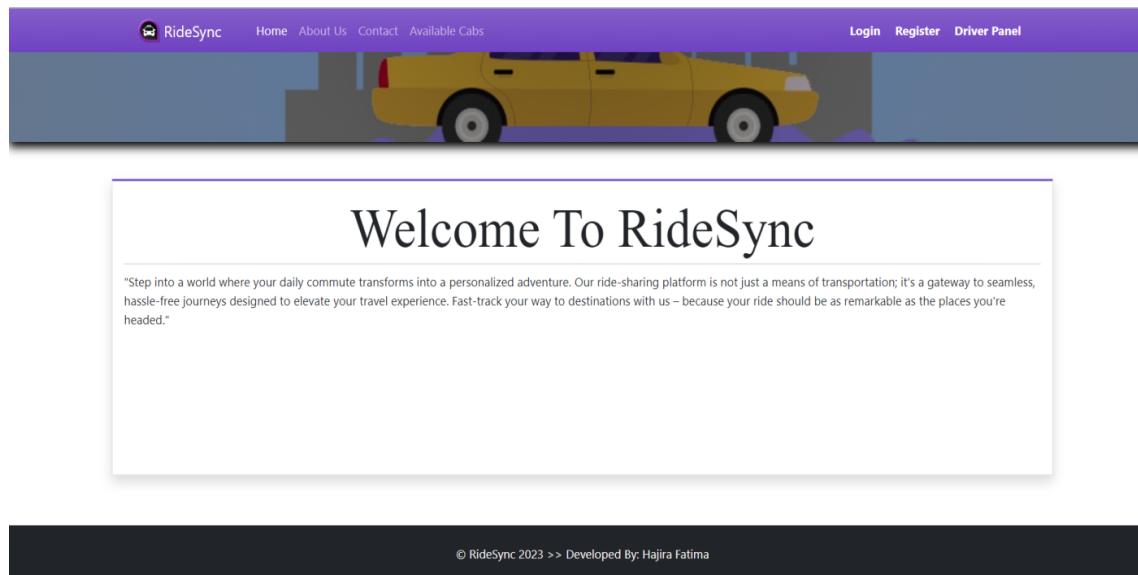

© RideSync 2023 >> Developed By: Hajira Fatima

The screenshot shows a search interface with a search bar and a green search button. Below the search area, there are two cards. The first card displays a car icon, the model 'Camry-440', and the text '6 Seater Toyota Camry'. The second card displays a car icon, the model 'Fusion-130', and the text '1 category Ford Fusion'.

Prototype Development

Web App:

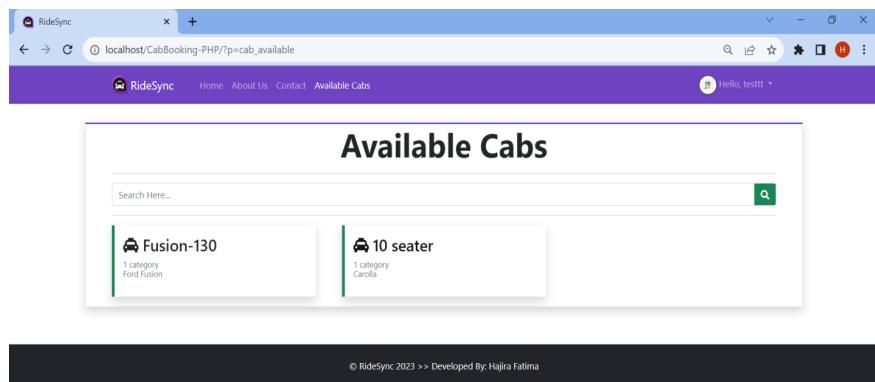

A screenshot of a web browser showing a registration form titled 'Create an Account - Client'. The form is divided into several sections: 'Enter First Name' and 'Enter Middle Name (optional)', both with input fields for 'First Name' and 'Middle Name'. There are also fields for 'Enter Last Name' and 'Last Name'. A gender selection dropdown shows 'Male' is selected, with 'Gender' and 'Enter Contact' fields below it. The 'Enter Contact' field includes 'Contact Number'. An 'Address' section contains a text input field for 'Enter Your Full Address'. Below this is an 'Email' field containing 'harryden@mail.com' and an 'Email' button. Underneath is a 'Password' field and a 'Confirm Password' field. At the bottom is an 'Avatar' section with a 'Choose file' button and a 'Browse' button.

The registration form for a user named Fatima. The fields include:

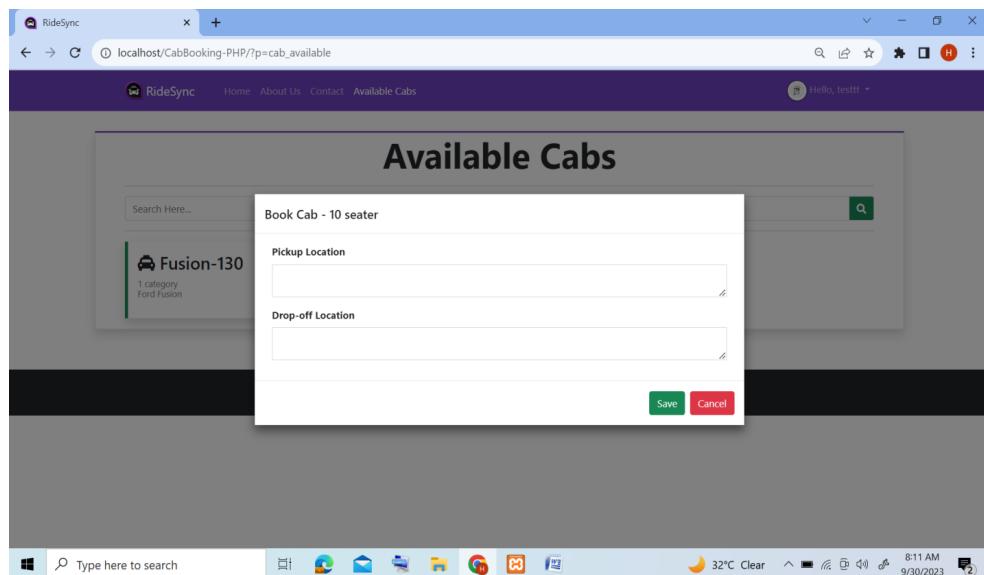

- Last Name: Fatima
- Gender: Female
- Contact Number: 123456790
- Address: hyderabad,pakistan
- Email: hajirfatima123@gmail.com
- Password and Confirm Password fields.
- Avatar section showing a placeholder image of a woman with blue hair and an orange top, labeled "grl.jpg".
- Buttons: "Back", "Register", and "Already have an Account".

The Client Login Panel features a purple circular icon with a white taxi cab silhouette. The panel includes:

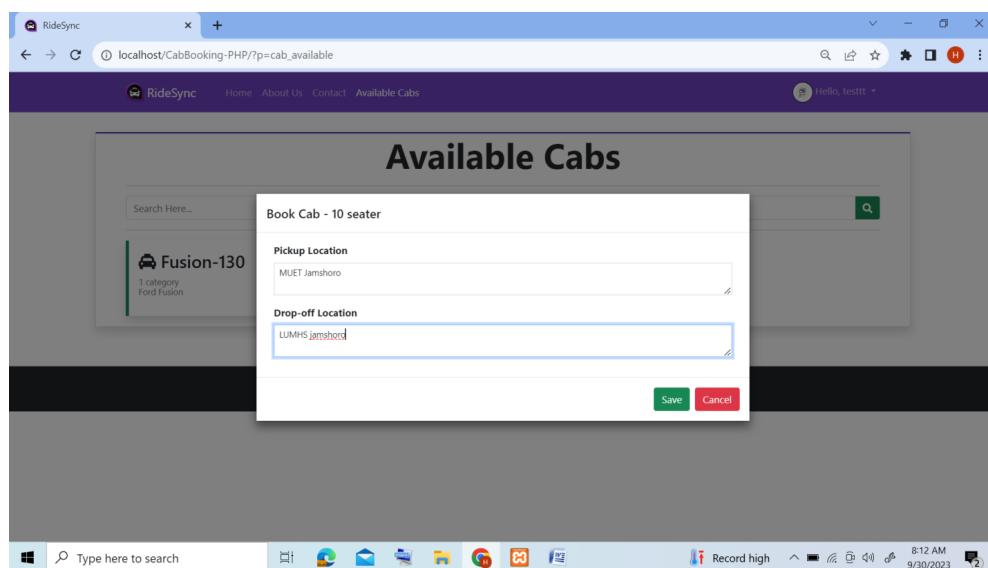

- "Client Login Panel" title.
- Email and Password input fields with icons.
- Buttons: "Back", "Log In", and "Create an Account".

Booking ride 10 seater

Giving pickup and drop off location

#	Date Booked	Ref. Code	Details	Status	Action

Booking confirm by driver

Booking confirmed

Client picked up by driver

The screenshot shows a web browser window for 'RideSync' at the URL 'localhost/CabBooking-PHP/driver/'. A purple header bar displays the RideSync logo and 'Home'. A green success message box in the top right corner says 'Booking status successfully updated.' Below the header is a table titled 'My Booking List' with columns: '#', 'Date Booked', 'Ref. Code', 'Trip Details', 'Status', and 'Action'. Three rows of data are listed:

#	Date Booked	Ref. Code	Trip Details	Status	Action
1	2023-09-30 08:25	202309-00002	Pickup: MUET jamshoro Dropoff: LUMHS jamshoro	Picked-up	View Details
2	2023-09-30 07:22	202309-00002	Pickup: latifabad Dropoff: qasimabad	Dropped off	View Details
3	2023-09-29 16:06	202309-00001	Pickup: abc Dropoff: xyz	Dropped off	View Details

At the bottom of the table, it says 'Showing 1 to 3 of 3 entries'. The status bar at the bottom of the browser window shows '© RideSync 2023 >> Developed By: Hajira Fatima'.

Client picked

The screenshot shows a web browser window for 'RideSync' at the URL 'localhost/CabBooking-PHP/driver/'. A purple header bar displays the RideSync logo and 'Home'. A user profile icon on the right says 'Hello, Ali'. A modal window titled 'Booking Details' is open in the center of the screen. It contains two sections: 'Cab Details' and 'Booking Details'. The 'Cab Details' section lists:

- Cab Body No: Fusion-130
- Vehicle Category: 1 category
- Vehicle model: Ford Fusion
- Driver: Ali
- Driver Contact: 09123456789
- Driver Address: 94 Chestnut Street

The 'Booking Details' section lists:

- Ref. Code: 202309-00002
- Pickup Zone: MUET jamshoro
- Drop off Zone: LUMHS jamshoro
- Status: Picked-up

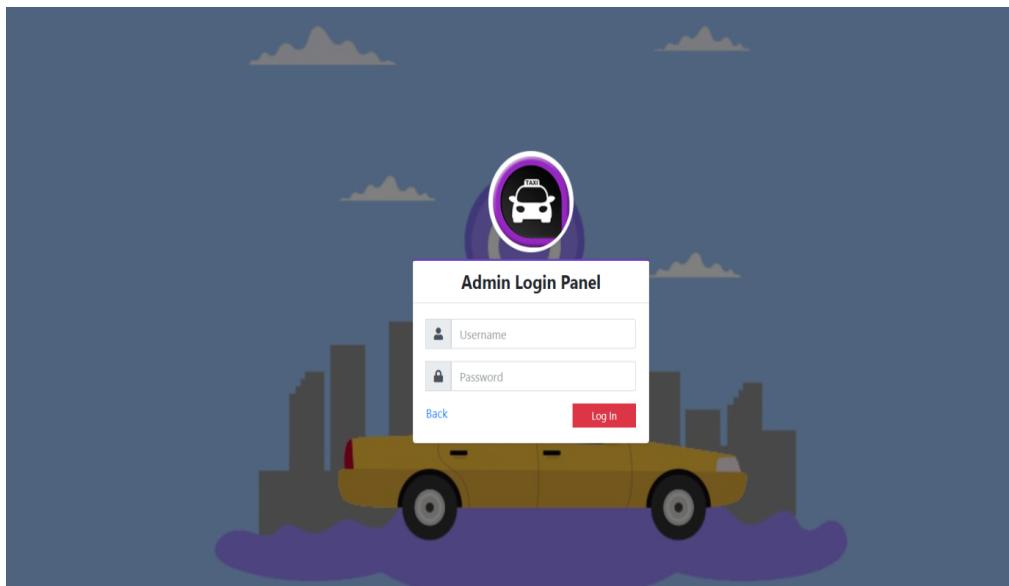

At the bottom of the modal, there are two buttons: 'Dropped Off' and 'x Close'. The status bar at the bottom of the browser window shows '32°C Clear' and the date '9/30/2023'.

Client drop-off by driver

The screenshot shows a web browser window for 'RideSync' at the URL 'localhost/CabBooking-PHP/driver/'. The title bar says 'RideSync'. The main content area displays a 'My Booking List' table with three entries. The first entry has a green 'Dropped off' button and a blue 'View Details' button. The second entry also has a green 'Dropped off' button and a blue 'View Details' button. The third entry has a green 'Dropped off' button and a blue 'View Details' button. Above the table, a message box says 'Booking status successfully updated.' with a checkmark icon. Below the table, there are 'Search:' and 'Action' filters, and at the bottom, it says 'Showing 1 to 3 of 3 entries' with 'Previous' and 'Next' buttons.

ADMIN PANEL

This view is available to admin

Admin can view following things

The screenshot shows the RideSync Admin Dashboard with a sidebar menu on the left containing options like Dashboard, Manage Category, Cab Management, View Bookings, Registered Clients, System Users, and Settings. The main area displays a grid of metrics:

Icon	Category	Value
C	Categories	1
Taxi	Available Cabs	3
People	Registered Clients	12
Bookmark	Bookings Made	7
Circle	Pending Bookings	2
Cancel	Cancelled Bookings	0
Up Arrow	Ongoing Trips	0
Checklist	Trips Completed	5
Users	System Users	1

At the bottom, it says "© 2023. All rights reserved." and "Developed By: Hajira Fatima".

The screenshot shows the RideSync Admin interface with the "Manage Category" option selected in the sidebar. The main area displays a table titled "List of Categories" with one entry:

#	Category	Description	Status	Action
1	1 category	test test	Active	Action

Below the table, it says "Showing 1 to 1 of 1 entries". There are buttons for "Add New Category", "Search", "Previous", and "Next". At the bottom, it says "© 2023. All rights reserved." and "Developed By: Hajira Fatima".

The screenshot shows the RideSync Admin interface with the URL localhost/CabBooking-PHP/admin/?page=cabs. The left sidebar has 'Cab Management' selected. The main content displays a table titled 'List of Cabs' with columns: #, Reg. Code, Category, Model, Details, Status, and Action. There are three entries:

#	Reg. Code	Category	Model	Details	Status	Action
1	202202-00001	6 Seater	Toyota Camry	Plate: ASTR0715 Driver: Sara	Active	Action
2	202202-00002	1 Category	Ford Fusion	Plate: ASTR0306 Driver: Ali	Active	Action
3	202309-00001	1 Category	Carolla	Plate: 1234567980 Driver: Kim	Active	Action

Showing 1 to 3 of 3 entries

The screenshot shows the RideSync Admin interface with the URL localhost/CabBooking-PHP/admin/?page=bookings. The left sidebar has 'View Bookings' selected. The main content displays a table titled 'Booking List' with columns: #, Date Booked, Ref. Code, Cab Reg. Code, Client, Status, and Action. There are seven entries:

#	Date Booked	Ref. Code	Cab Reg. Code	Client	Status	Action

MOBILE App

Conclusion

The electrifying synergy between EV charging stations and ride-sharing platforms holds great promise for the future of sustainable transportation. By strategically integrating these solutions, EV owners can conveniently access charging infrastructure while ride-sharing services benefit from improved station utilization. This symbiotic relationship contributes towards reducing range anxiety, promoting green mobility, and accelerating the adoption of electric vehicles. As technology advancements continue to streamline the convergence of these solutions, the future of electric vehicles and ride-sharing looks bright and sustainable.

Key Findings

Several charging infrastructure providers have successfully integrated renewable energy:

- Tesla Supercharger Network: Tesla integrates solar panels at many of its charging stations, reducing grid dependence and showcasing the feasibility of renewables.
- Enel X's e-Mobility Solutions: Enel X incorporates wind and solar power into its charging infrastructure, promoting eco-friendliness and grid stability.

Comparison of Charging Electric Vehicle from Wind and Solar energy		
	To integrate into Platform's Charging Infrastructure	
	GENERATED FROM	RATED IN
SOLAR Energy	CAN ALSO BE INSTALLED ON THE ROOFS OF BUILDINGS.	ORDER OF KILOWATTS WHICH IS SIMILAR TO THE POWER RATING OF AN EV CHARGER.
Wind energy	ONSHORE OR OFFSHORE WIND FARMS	RATED ON THE ORDER OF MEGAWATTS
		RESULTS
		<p>IN CONTRAST TO WIND GENERATION, SOLAR GENERATION IS MAXIMUM IN THE DAYTIME AND SUMMER. HENCE, SOLAR GENERATION IS IDEALLY SUITED FOR CHARGING CARS AT WORKPLACES DURING THE DAY.</p> <p>WIND GENERATION IS IDEALLY SUITED FOR CHARGING ELECTRIC CARS AT HOMES AT NIGHT. HENCE WIND GENERATIONS ARE IDEALLY SUITED FOR CHARGING ELECTRIC CARS AT HOME AT NIGHT</p>

wind generation is ideally suited for charging electric cars at homes at night. Hence wind generations are ideally suited for charging electric cars at home at night. In contrast to wind generation, solar generation is maximum in the daytime and summer. Hence, solar generation is ideally suited for charging cars at workplaces during the day.

Another solution to help match renewable generation and EV charging is smart charging. When solar and wind output is high, EV charging power can be increased and vice versa. This has the dual benefit of making EVs sustainable by using more green energy and reducing stress on the grid due to large-scale renewable energy generation.
